CLIMATE ACTION TRACKER

Argentina

Page last updated: 25th June 2012

Assessment

Argentina is active in the international negotiations and has provided two national communications. A national climate policy is due to be agreed and published in 2011. It submitted only a list of measures as NAMAs that cannot be translated into emission levels and is therefore rated Inadequate. Argentina can move to Medium or Sufficient if and when such a plan is provided.

Description

Argentina submitted a list of unilateral and supported mitigation actions currently being undertaken across various sectors.

Status

Source

Argentina's second National Communication to the UNFCCC (2007)

Assumptions

Argentina provided a national greenhouse gas inventory for the period from 1990 to 2000 only and no emission projections. We used growth rates from the IEA's report on CO2 Emissions from Fuel Combustion (2009) to cover the period from 2001 to 2010. BAU projections are based on the growth rate published in the IEA World Energy Outlook 2009.

For the current trends projections, we calculate emissions reductions based on sectoral data and subtract these from the BAU. As an alternative scenario, we use growth rates from WEO 2012 for Latin America for the years after 2010.
